The certification cover over **40 AWS services**
Creation resources in the cloud cost money.

Creating and AWS account require an email for the root user and and AWS account name. You also need a password to authenticate with your root email.

Cloud computing is the on-demand delivery of compute power, database storage, applications, and other IT resources.
Through a cloud services platform with pay-as-you-go pricing
You can provision exactly the right type and size of computing resources you need

1 IAM

1.1 IAM Security Tools

IAM Credentials Report (account-level) is a service used to lists of all your account's users and the status of their various credentials.

IAM Access Advisor (user-level) is a service used to shows the service permissions granted to a user and when those services were last accessed. You can use this information to revise your policies.

Don't use the root account except for AWS account setup

2 EC2

AWS has the following naming convention:

m5.2xlarge

- m: instance class
- 5: generation (AWS improves them over time)
- 2xlarge: size within the instance class

2.1 Security Groups

Security Groups control how traffic is allowed into or out of our instances.

Security groups only contain **allow** rules.

Security groups rules can reference by IP or by security group.

They controll both inbound and outbound traffic

If your application is not accessible (time out), then it's a security group issue.

Usage beyond Savings Plans is billed at the On-Demand price.

2.2 EBS Volume

They can only be mounted to one instance at a time.

They are bound to a specific availability zone.

It's locked to an Availability Zone, to move a volume you need to take a snapshot.

2.3 EBS Snapshots

Make a backup (snapshot) of your EBS volume at a point in time.
